

STARS 2 - LIVING BEINGS WITH CONSCIOUSNESS / SPACE SUITS **NO VIDEO**

Published 23 September 2020 by ATTACHE, english

Text only / Translated originally from Spanish

Questioner: I understand that stars are living beings like planets. How is their consciousness? How does their mind work? Are they aware of our existence?

Anéeka: In itself, that question is more appropriate for Yazhí, because she knows these things firsthand.

But from what I have learned: All consciousness is composed of other simpler ones, both in the same plane as well as in other

planes and timelines, which are not separated or isolated from each other, but rather influence each other all the time.

So a human body, to use it as a reference because any other could work too, is a set of separate consciousness's or individuals,

which together make up the human body.

Those individuals are the cells. Each one contains all the internal organs like a human body. They are called organelles, but they

are all there in their form, from the gastric, nervous, reproductive and excretory systems. Where, for example, the reproductive

system would be the nucleus and the nervous system or brain would be the cell membrane, the outer part, and the mitochondria

would be partly the energy system.

So each cell, in its own small way, creates its own understanding about its environment that surrounds it, chemical, toxicological

and oxygenation, and each one will take its own measures for its conservation as a living being.

If they are in a conducive environment, they flourish and give way to the health of the entire human-individual that contains them.

If the environment is not conducive, and it is highly toxic, the cells will do everything possible not to succumb to this situation, so

they do not die naturally and remain alive as long as possible. As an example or a separate note, causing the majority of cancers.

All the consciousnesses of each individual cell according to their internal programming come together to form a group or

cooperative community, something that would be called a complex multicellular body, or human body in this case.

As with a human body, or any other, and taking into account that everything is energetically connected and interdependent, just

as the consciousness of the human being is itself the totality of the consciousness of each of the cells that compose it and

emphasizing that each cell will have a connection to the etheric field and the connection with other cells of other bodies, human

or not, being exactly the same for a planet.

That is to say, without neglecting that it has its own consciousness, an individual “me”, it is the result of the consciousnesses

that compose it as cells inside. And the planet itself is part of a larger organism. And that one forms another.

Side note: Each cell will have its own connection or version of connection with the etheric or spiritual side.

That is to say that the Pineal Gland, contrary to what is said, is not the only point in the body that is responsible for extrasensory

perception and the connection with the unified field, but rather the whole body as a whole gives or receives said connection.

The Pineal Gland is only the most obviously active element within a system within a whole. So that topic of decalcifying the

Pineal Gland is something quite simplistic. The truth is that it is necessary to improve the connection of the whole body as a

unified whole and, in this process, the Pineal Gland will obviously benefit in a way that would be far superior to the localized form

of "decalcification".

Questioner: So a planet would be made up of all the consciousnesses/people that inhabit it? And a star of all the

consciousnesses of the different planets that surrounds it?

Anéeka: Yes. Everything interconnected, the star of a constellation, the constellation of a cluster, the cluster of a galaxy, the

galaxy of its local group, and so we go on until we reach the whole, the consciousness that unifies everything.

Every plant, every ant, every little cell that lives on a planet is part of its consciousness and part of the great whole.

Questioner: Can you communicate with a star? If I remember correctly, you said that the Earth, the planets, communicated through sacred geometry. Also the stars?

Anéeka: Yes, but we don't see concrete evidence of engaging in a conversation with a planet, in human-understandable terms, on our scale of consciousness. It has its own way. In other words, it is as if a single cell in your pancreas wanted to tell you something. There is an influence, but coming more from you towards the cell, than from the cell towards you. Even so, some people do claim to be able to have a conversation with a planet.

In itself everything is geometric, everything is a mathematically understandable relationship. It would be the only way to have a common language.

Questioner: You said the other day that the stars are cooperating with each other, how is this cooperation? How is the information passed between them? Is it like the trees in a forest?

Anéeka: Yes, the stars, like consciousnesses, are intertwined. The field that intertwines them all is like a web of scalar

electromagnetic energy flow (that is, of all densities and frequencies) that interconnects everything, from the etheric side. Like an energetic thread which goes from each star connecting it with all the others.

These energy threads can be exploited in the form of portals and are called Wormholes or Einstein Rosenberg Bridges.

Therefore, we have explained how a portal in a sun can be used to go from one point to another, using the ether within, because all the suns are connected.

So you can enter a solar portal (sunspots) with a ship. Once inside, if you have an energetic map, you can navigate said "cobweb" to get to another sun closer to your destination.

This is widely used to this day as a transit system between races and interstellar races of less technological evolution than

Taygeta, for example, since Taygeta has ships which manufacture their own wormholes at will and we do not need solar portals or nothing like that.

And yes, it is like the trees in the forest.

Questioner: Would the connection then be similar to the communication that neurons have in the human brain?

Anéeka: Yes. It is exactly the same system. Because it is based on exactly the same pattern of energy formation or harmonic

dynamics of a frequency, using Yázhi terminology.

Questioner: So, do they balance each other? Like trees that exchange water, according to their needs, among others?

Anéeka: This is correct. Yes, they balance, they communicate, they talk, they exchange energy.

I can feel the humor of a tree. But Yazhí is extreme, since she can conversation with a tree and even get specific information from

it.

Questioner: I have a question about something you said before. When you use the suns to move around, is entering a sun as a

portal like jumping into the ether? Meaning there is no travel time, only the crew SIT time?

Anéeka: Yes, exactly. The sun or suns are the ones that provide the energy and the energetic direction towards which the ship will go.

The ship only has to be consistent with that energetic direction, so, since equal frequencies tend to be more of the same, the ship will go in the "direction" that the crew wants.

But for us it is not necessary, and it also seems dangerous to us to use solar portals. Because the suns are not static, and they change their energy dynamics for their own reasons, as stated above.

Questioner: You commented that when a star dies it becomes a gravity hole. What happens next to this hole? Does it stay this way? Is it a portal, to where? Do they still connect with the same things as when they were a star?

Anéeka: Yes, it is still the same or connected as it was when it was a star. As everything is changing and depending on the flow of energy between the connected stars, this gravity hole can get bigger, turning into a black hole, or it can become less and less strong, until it dissolves in space, remaining as if there was never a star there. Or a gravity hole can even grow back and reignite as a star.

In itself, the genesis of the stars is something along those lines precisely. It receives a lot of energy at that point, energy in the

form of gravity. Then it begins a dynamic of electromagnetic flow at that point and receives that energy from "below" through the

wormholes that connect it with other stars, and even energy already shaped as matter, as are gases of all kinds which become

plasma and, combined with the electromagnetic aspect of a star, it becomes what we see as the sun.

As Yazhí Swaruu would say, it has specific harmonics of its frequency, so that it is formed at that point or concentration of gravity

in space.

Questioner: And what relationship do the stars have with the planets?

Anéeka: They are part of the same system, they are like their energetic daughters, points of attention of a creative attention. In

itself, everything is on purpose, nothing fortuitous, you can only see a mathematical logic in everything and see that as the

cause, when it is the effect. The suns feed the planets with light and energetic stability and that makes the so-called organic life

to form in them, which in turn, feed their consciousness, in a symbiosis.

As for energetic connections, the planets are filled with portals or a main portal which connect it to its sun and to the other planets of its system.

Questioner: And with all this, what specific function does the central sun of the galaxy have?

Anéeka: Everything is connected. More than a function it is the point of greatest concentration of energy of all kinds, you could

say gravitational, but gravity is a flow of consciousness in the ether. In other words, the center of a galaxy is the point where all

consciousness is concentrated, of everything that is in the said galaxy. As it is toroidally formed, the nucleus is the motor of the

galaxy and of everything that is in it. Everything from that galaxy and in that galaxy starts from there and is formed from there.

Questioner: Excuse me, energetic daughters, what do you mean? Are you referring to the planets or the stars? I imagined stars

more as mothers.

Anéeka: The planets, energetically, are the "daughters" of their star. A manner of speaking more than anything.

Questioner: What is really a star? How is its shape? Understanding that from here we only perceive 60% of reality in 5D.

Anéeka: As everything is a toroid in shape, it is a very concentrated scalar electromagnetism emission, outflow, like a black hole

is the incoming energy flow. But it is not a thermonuclear ball as human science describes it, it is something much more

complex. They are not "burning" hot gases.

And its energy does not come from within itself either, but from the unified field, and will only grow or become extinct, according

to a complex internal energy system of the field which interconnects all the suns. The sun is an energetic exit hole. But because

it is multiplane, multidimensional scalar, a hole is perceived as a sphere, not as a flat disk.

But human science does not conceive that it draws energy from other planes that are not visible and not understood by them, so

they go towards the explanation that is more in line with their level of understanding: Thermonuclear Ball.

So in itself, the Sun is not hot as they describe it, it does not have high temperatures in that way, although all electromagnetic

plasma compressed at one point, like a sun, does produce heat and a lot. But it is not what generates said heat.

So, it is safe to approach a sun with a ship, but it is like going against the current of a river flow. But this is solved using the same

ship, to change its mass with the engines so that this solar flux (known on Earth as solar wind, but it comprises more

components not visible to human science) affects it less.

That is why you can approach a sun and enter it using sunspots, because they are points with little or any output magnetic flux,

or only of certain frequencies.

So the planets do not depend on the distance from a sun to receive heat from it. Being that the human theory of the point within

a solar system where a planet must be to be habitable is false. The Earth does not have a pleasant temperature because the Sun

warms it. Rather, the scalar radiation from the Sun is translated by the Earth's

atmosphere and its own energy field to produce heat, as a reaction.

For this reason, it can be very hot on the surface of the planet, in a desert for example, but on the same day at the same time over that desert, in an airplane, it is many degrees below zero.

Questioner: I understand, that's why you commented that if the Sun were a thermonuclear ball it would go against the law of thermodynamics.

Anéeka: Yes. How is heat transmitted through a void like space? Human science contradicts itself, but these obvious problems it don't seem to bother anyone. And space is not a void either, by the way.

You don't need a pressurized suit to be in space either. They show space as a cold place where, if a spacesuit breaks, you would freeze in seconds. Let's see, scientists, explain to me: Where or how is that body heat transferred from the astronaut that freezes in seconds, if there is no means of heat transmission?

In space, cold is not a problem. Why is it cold in the first place? If there is supposedly nothing to measure. So they would only

measure the temperature of the thermometer itself.

What happens is that human science defines cold as the absence of molecular movement, and with this rule they even say that

the temperature of interstellar space is absolute zero or $-273.15\text{ }^{\circ}\text{C}$.

The cold of space is not a problem for any spaceship or crew. Heat is. Because you can't easily radiate excess heat from a ship,

that's the problem. So, in spaceships like ours, the systems are very complex to transform excess heat into other reusable

energy form. We convert heat into electricity.

Questioner: Why don't you need a pressurized suit? Sorry Anéeka, I didn't understand very well.

Anéeka: Because in human science they say that without a pressurized suit, the gases naturally contained in the blood would

tend to expand due to lack of atmospheric pressure. Because the human body is

pressurized to 1 Bar or a Barometric

measurement equivalent to atmospheric pressure at sea level.

Meaning atmospheric pressure wants to compress the body by its weight, of the entire atmosphere. And to compensate for this,

the body is pressurized precisely to 1 Bar, which is equivalent to neutralizing that pressure to zero.

Therefore, if you rise or fall from sea level quickly, your ears get plugged and other harmless bodily phenomena occur. But if you

have a human body pressurized to 1 Bar and you take it into space, you will have a Barometric measurement of outward

pressure. So the body explodes, because it expands due to lack of atmospheric pressure to compensate for it.

Therefore, in itself, before the blood explodes, it will tend to boil, because the gases contained in the blood will expand. This

problem is also seen with divers. Therefore, they must come up slowly so that their bodies get used to the new pressure,

releasing gases in a controlled and progressive way before they cause damage to tissues, veins and arteries.

Now, in space, all you have to do is accustom your body to a Barometric pressure

equivalent to zero. For that, you only need a

hyperbaric chamber. Where the subject can release the internal gases of the body, up to equivalent to zero pressure. In other

words, the equivalent of space. In itself, this is simpler than accustoming a body to the pressure necessary to perform deep

diving work, something that is done daily on Earth.

So to be in space without a spaceship, that is to say on a spacewalk, you don't need complex pressurized suits. The only thing

you really need is a respirator with the correct mixture, and, at the correct low pressure with recirculating air, like when diving, not

tanks, a re-breather.

And for a suit, only basic protector. But technically you can wear your favorite shirt and sneakers.

There are people who have just studied the gloves of that suit. And they would never work. Because pressurized, they couldn't

even move their fingers. It is absurd.

Questioner: Thank you very much, Anéeka. Now I have understood better. So the cold is not a problem for the person?

Anéeka: Not a problem, because from 3D or 5D in space there is no transmission medium for heat. Moreover, if you are working

in space, outside, repairing the ship, you have a tendency to overheat and even have nausea, due to body overheating.

We do have spacesuits, but they are simpler and closer to the body, offer another kind of protection and have cooling systems,

for astronauts doing physical work outside.

Basically, they have a system of tubes with fluid that re-circulates throughout the suit cooling the astronaut, but we have other

high-tech ones, which use magnetic frequencies to cool them. But the cold is not a problem, it is the heat. As you can see, our

concepts of space differ greatly from humans.

Questioner B: What makes increase the temperature of people in space? Are there any problems with solar radiation?

Anéeka: Very easy. It's not that something causes their temperature to rise, but their

own body, which is designed to radiate

unnecessary heat. It cannot do so because there is no air and there is no transmission medium. Therefore, the temperature

gradually builds up.

But it is not something strange, it is pure thermodynamics. It is the same with spaceships or with anything else. Energy cannot

be destroyed; it can only be transformed into something else. Therefore, we convert heat into electrical energy, which will be

used in anything.

Questioner: And does anything happen if you spend a lot of time just in space walk, then? Or you just get very warm like on the

beach?

Anéeka: Yes, you get overheated and that is dangerous for the body. You overheat like having a slight fever, then a stronger one.

If it exceeds 40°C, serious problems begin, and by continuing to rise it can cause brain and organ damage.

On the beach you can still radiate with sweat and the breeze, not in space. You suffer thermal shock. But for that, you use space

suits. But it's more like a second skin. Not like those of NASA.

Questioner: So if you have to do a long-term operation, do you wear space suits?

Anéeka: Yes, generally for protection. Although it is possible not to wear anything for very short periods of time, it is not

recommended. The uniform suit is used. It has many functions, it doesn't only keep the temperature at the correct temperature, it

cools you if you are hot, or it warms you if you are cold, in space or wherever. It also shields against all kinds of impacts, from

debris to bullets. It becomes rigid in a nano second, becoming impenetrable. If you fall from somewhere, it prevents fractures. It

is made of high-tech, self-healing, polymorphic resin fabric.

Questioner: And how do you breathe?

Anéeka: To breathe we use a transparent helmet and a re-circulating tank on the back. Like the diving one, but smaller. You don't

escape the transparent helmet, although you could have it only in your mouth and that's it, but it is very uncomfortable and even

dangerous. Also, the system must be calibrated for space, or zero pressure, or the respirator itself can damage your lungs.

ANOTHER CHAT:

Questioner: When a star dies, becoming then a gravity hole, what happens to the planets that orbit it?

Yazhi: It absorbs them, it becomes part of its mass when the dynamics or balance that existed between them when it was a star

changed or stopped. I mean... they are destroyed.

Questioner: And what about the consciousness of the planets and their inhabitants? What process do they go through?

Yazhi: It is a process that would be like death. They pass to other things, to other planes. But the consciousness of the planets

themselves is closely linked to the one of their sun, being part of the same. And they do not regard it as something tragic,

because that is human thought or interpretation.

And before that, the energetic dynamics of the planets change with the star itself, ergo when that collapse happens, there has

been no biological life there in them for a long, long time already. It is a gradual process and unique for each case.

Questioner: Look, I was just going to ask this. And can this be detected living in 5D? For example, being able to realize that this

will happen and move to another planet or something like that? But I understand that there would no longer be anyone living

there.

Yazhi: Yes, and in a limited way from 3D too. But it is only a point of view or perspective in particular, taking into account that

from other planes, the stars are always there, being outside of time, because they are very definitely high consciousnesses, of

high densities. Where there is no time as it is known. They are only getting destroyed from the point of view of low densities, of

the ones who observe the process.

Questioner: I understand. And at what level of consciousness or evolution is a star?

Yazhi: I can't quantify it. Again, to talk about a density with a number would be inappropriate and limited. In themselves they are

in all densities, however these are understood. From the most basic, just being, to the highest, as consciousness of the whole.

Practically being the Source itself, but still preserving something of its own identity as a star.

That is why they are so interconnected with each other energetically and in a scalar way. That is, in very high densities, which is

described as wormholes which interconnect the stars, all of them.

In itself this network of connections between the stars can be interpreted as what determines that all of them, all the stars, are

both unique and particular and at the same time they are a single "thing", a single cluster of consciousness. A single cosmic

super-being with each star as a node of itself, interconnected through high densities, of the ether. A super being, that is in all

densities and that is impossible to understand with the normal mind.

A great something, which could be said to be the galaxy itself... like a being seen by or from the position of 3D. All connected,

forming a single consciousness, that sees or perceives itself, as someone... the

galaxy.

And, at the same time, connected with others, as if each of the galaxies were a single star, because there are so many.

Interconnected as the stars are to form another even greater Super-being, with even more consciousness. And the same thing

happens lower too. Because each being with consciousness that exists is not a single being, but the sum of the

consciousnesses that form it, consciousnesses from their simplest point of view. Simple ones that come together and add up to

form a more complex one.
